

ABSTRACT OF THE DISCLOSURE

The invention relates to a self-locking osteosynthesis device of the type comprising a plate (1) which is equipped with holes (2) for the passage of fixation screws (3). The invention is characterised in that, at least in the areas (4) defining the screw holes (2), the aforementioned plate (1) is made from a material having mechanical properties such that the periphery of said holes can be self-tapped by means of tapping screws which can be used to fix the plate.
